The present sequence, the promoter region of which is claimed, is the 1-CC aminocyclopropane-1-carboxyllc acid synthase (ACC synthase) LE-AC97 gene con tomato chromosome 2. The gene was isolated by a combination of PCR con tomato chromosome 2. The gene was isolated by a combination of PCR con tomato chromosome 2. The gene was isolated by a combination of PCR con tomato chromosome 2. The gene was isolated by a combination of PCR con to transiently induced in waterlogged roots and in wounded con the combination with LE-ACS7 transcript forms a combination with LE-ACS7 transcript forms a control pattern that slightly precedes the diurnal fluctuation of the provide and the provide transient expression of a desired protein or mRNA conditions are considered by the protein or mRNA conditions. The provide transient expression of a desired protein or mRNA conditions, such as flooding or wounding, without the application of the stress, such as flooding or wounding, without the application of contents. The LE-ACS7 promoter can be recombinantly fused to a heterologous nucleic acid to produce claimed recombinant expression contents. Plooding can be used to induce expression of e.g. genes that control resistance to insect pests or pathogens, or which confer contents are promoter may be used to transcribe an mRNA that is not translated into a protein. e.g. antisense RNA or ribozymes. The LE-ACS7 confer comoter contains an region, designated LEACS75013, that shows homology can be used to transcribe an mRNA that is not transcribe and the promoter contains and region, designated LEACS75013, that shows homology can be used to protein e.g. antisense RNA or ribozymes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        exon
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            SdO

/note="Vector: pBlueScript SK(-); Site_1: EcoR1; Site_2:
Xho1; supplier: Giovannoni; Fruit were tagged at the
breaker stage (first sign of lycopene accumulation on the
blossom end of the fruit) and harvested 7 days
post-breaker (fully red-ripe), 10 days post breaker, and
20 days post-breaker (over-ripe). 20 day fruit which
showed external or internal signs of pathogenesis were
discarded. Fruit were cut in half and the seeds and
locules were discarded prior to freezing the pericarp."

/clone lib="tomato fruit red ripe, TAMU"
/note="Wector: pBlueScript SK(-); Site_1: BCOR1; Site_2:
Xho1; supplier: Glovanmoni; Fruit were tagged at the
breaker stage (first sign of lycopene accumulation on the
blossom end of the fruit) and harvested 7 days
post-breaker (fully red-ripe), 10 days post breaker, and
20 days post-breaker (over-ripe). 20 day fruit which
showed external or internal signs of pathogenesis were
discarded. Fruit were cut in half and the seeds and
locules were discarded prior to freezing the pericarp."

/note="Vector: pBlueScript SK(-); Site_1: EgoR1; Site_2:
Xhol; supplier: Glovannoni, Fruit were tagged at the
breaker stage (first sign of lycopene accumulation on the
blossom end of the fruit) and harvested 7 days
post-breaker (fully red-ripe), 10 days post breaker, and
20 days post-breaker (over-ripe). 20 day fruit which
showed external or internal signs of pathogenesis were
discarded. Fruit were cut in half and the seeds and
locules were discarded prior to freezing the pericarp."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            6785
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        461;
                                                                                  The predicted N-terminal AA sequence of PG-2a occurs at AA72. Since the ATG at bp 51 codes for the only inframe methionine preceding the N-terminal sequence of PG-2a, it is probable that the mRNA is translated with a 71AA pre-sequence that is subsequently cleaved to give a 41,828D mature protein.

Sequence 49, Application US/10691374

Publication No. US20040250322A1

GENERAL INFORMATION:

APPLICANT: McCallum, Claire

APPLICANT: Slade, Ann J.

APPLICANT: Slade, Ann J.

APPLICANT: Knauf, Vic

APPLICANT: Anawah Inc.

TITLE OF INVENTION: Transtoes Having Reduced Polygalacturonase Activity Caused by N.

TITLE OF INVENTION: Transgenic Mutations in the Polygalacturonase Gene

FILE REFERENCE: MBHB 02-276

CURRENT APPLICATION UNMBER: US/10/691,374

CURRENT APPLICATION DATE: 2003-10-22

NUMBER OF SEQ ID NOS: 50

SOFTWARE: PatentIn version 3.1

SEQ ID NO 49
